

# HUNTING FOR WILD ANTARCTIC ASTRO-PARTICLES

---

J. C. Hanson (CCAPP, The Ohio State University)

April 11, 2017

Earth Sciences 5650, Glaciology

# HUNTING FOR WILD ANTARCTIC ASTRO-PARTICLES

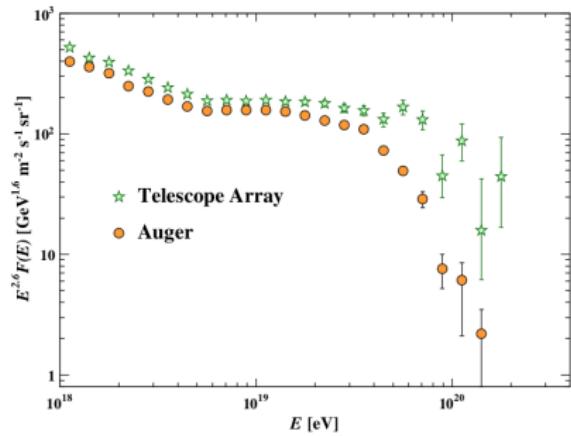

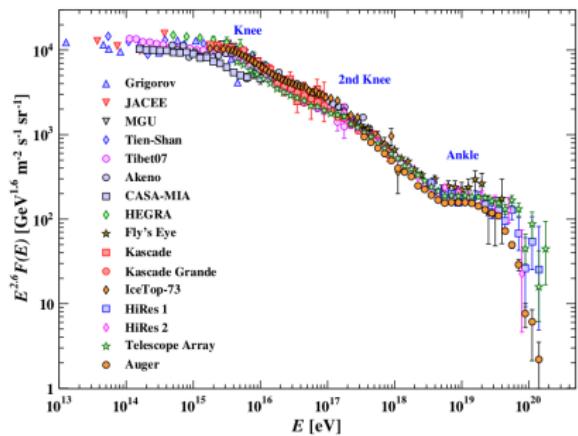

- I. UHE- $\nu$  observations, and a 100-year physics problem
  - A. UHE: Ultra-high energy  $\approx 1$  EeV ( $10^{18}$  eV), or 0.1 J
- II. Antarctica is not a *venue*, but a *target*
  - A. The Askaryan effect
  - B. Ice properties
- III. Undergraduate research with ARA and ARIANNA
  - A. Idea → Design → Testing → Deploy → Analysis
  - B. Monte Carlo simulations, glaciological modeling
  - C. RF circuit/antenna design, systems integration
  - D. Logistics
- IV. The ARIANNA-HRA, and Recent Results
- V. ARA2, and Recent Results
- VI. Future Opportunities

# UHE- $\nu$ OBSERVATIONS, AND A 100-YEAR PHYSICS PROBLEM

---

- Protons
- Electrons
- Gammas
- Gravitational Waves
- Neutrinos

# THE UHE COSMIC-RAYS (UHECR): PROTONS AND NUCLEI AT THE HIGHEST ENERGIES

Energies per nucleus span *seven orders of magnitude*.

## GZK PROCESS, UHECR $\rightarrow$ UHE- $\nu$

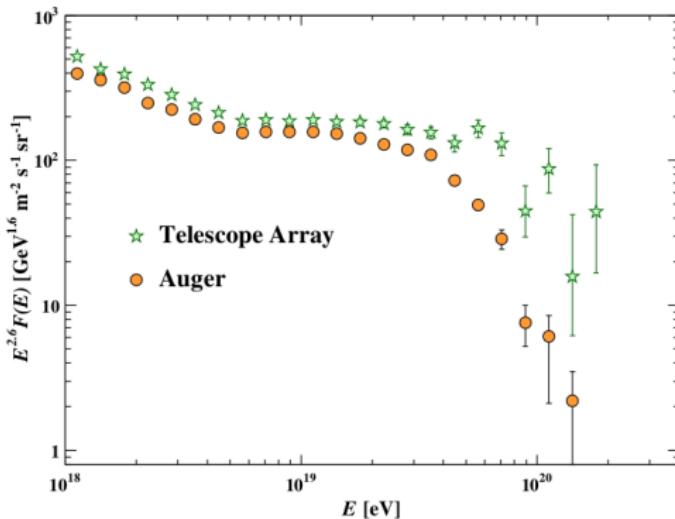

The **GZK Process** describes UHE- $\nu$  production when CR's interact with the Cosmic Microwave Background (CMB):

$$p^+ + \gamma_{CMB} \rightarrow n^0 + e^+ + \bar{\nu} + \nu + \nu \quad (1)$$

$$\rightarrow n^0 \rightarrow p^+ + e^- + \bar{\nu} \quad (2)$$

$$p^+ + \gamma_{CMB} \rightarrow p^+ + \gamma + \gamma \quad (3)$$

# UHECR AND THE GZK-CUTOFF

**Figure 3:** The drop in flux at right is most likely caused by the GZK effect [10].

# THE RACE FOR UHE- $\nu$

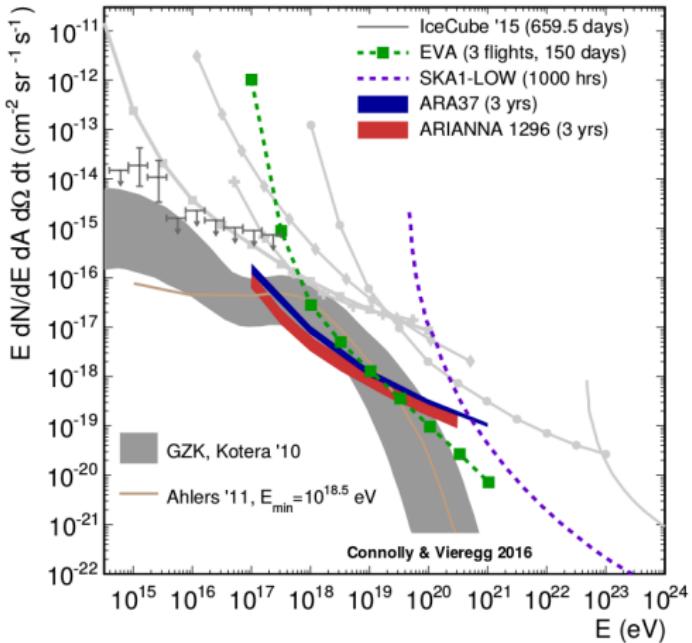

Figure 4: Predicted UHE- $\nu$  fluxes from UHECR flux at Earth [1].

ANTARCTICA IS NOT THE VENUE, BUT THE  
TARGET

---

# WE NEED A BIG TARGET: EFFECTIVE VOLUME AND ICE PROPERTIES

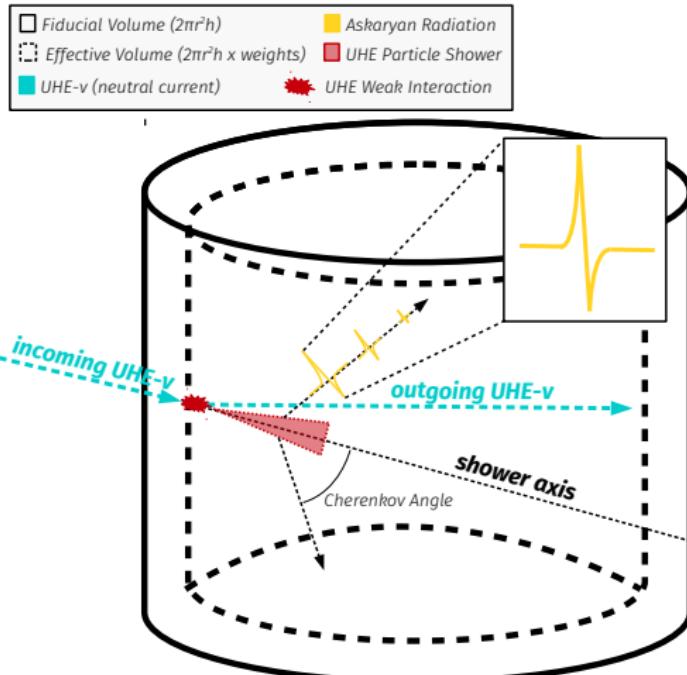

Figure 5: Concepts of effective volume, and attenuation length.

# ANTARCTIC ICE PROPERTIES

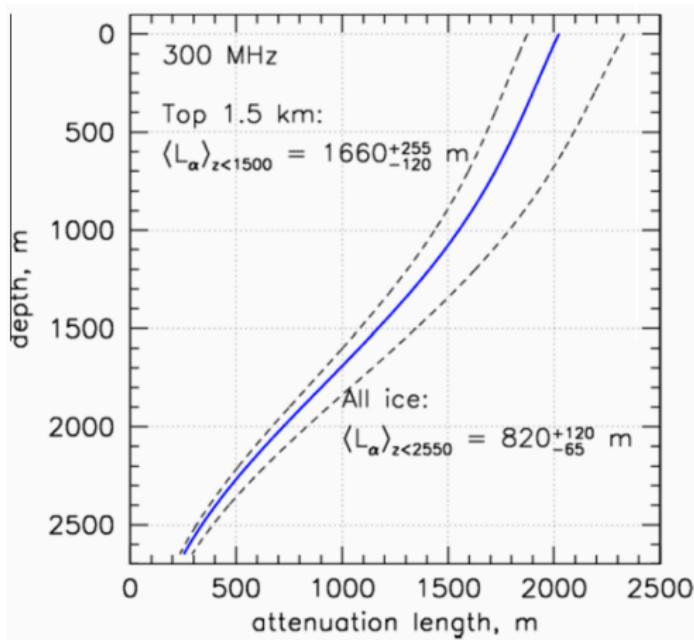

Figure 6: The attenuation length versus depth at the South Pole [3].

# ANTARCTIC ICE PROPERTIES

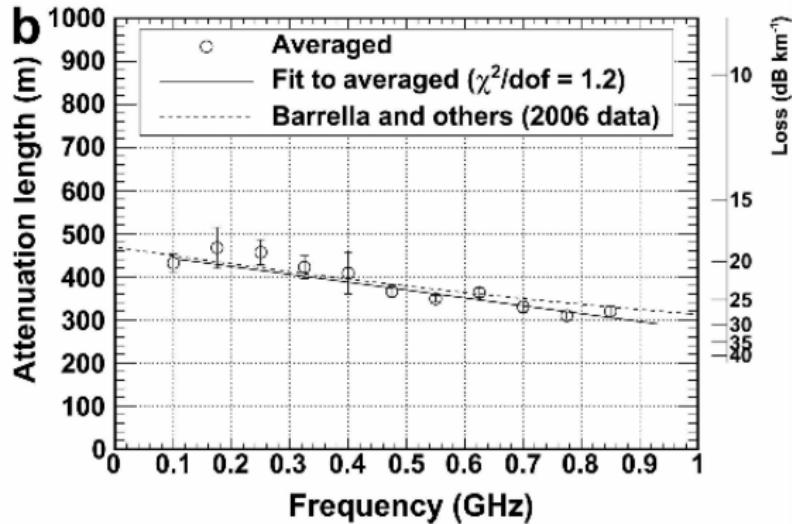

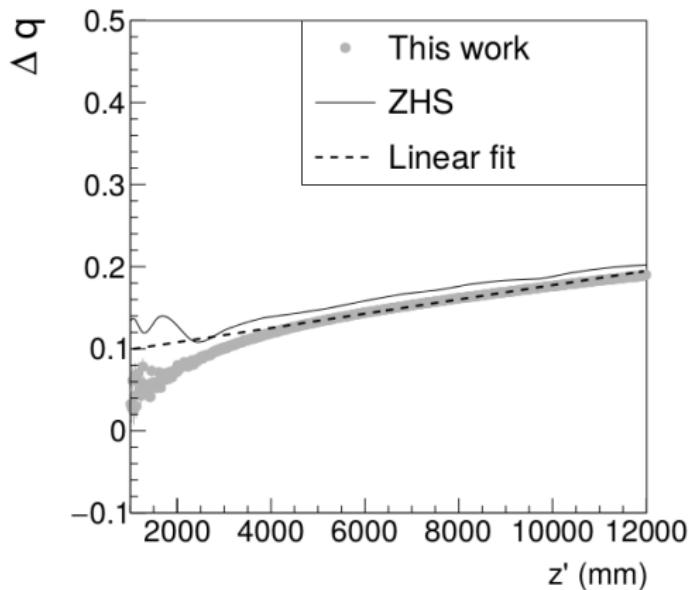

Figure 7: The attenuation length versus depth in Moore's Bay [5].

# THE ASKARYAN EFFECT - NEGATIVE CHARGE IN CASCADE RADIATING

**Figure 8:** As the cascade progresses, the negative charge excess increases [8].

# THE ASKARYAN EFFECT - FIRST OBSERVATION AT SLAC

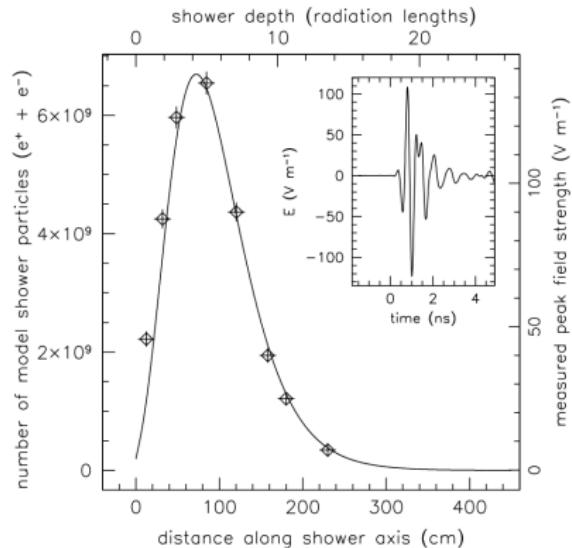

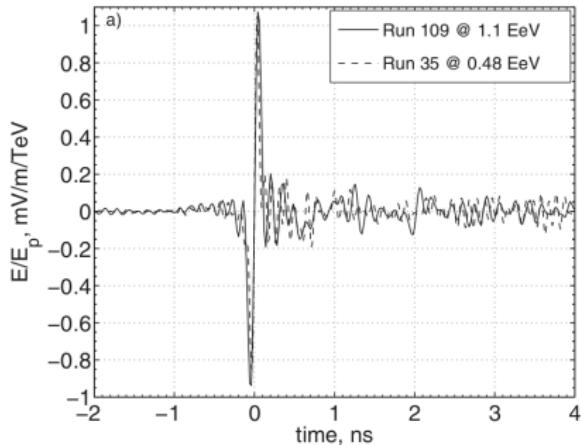

Figure 9: D. Saltzberg et al. observed the Askaryan Effect at SLAC [13].

# THE ASKARYAN EFFECT - FIRST OBSERVATION AT SLAC

**Figure 10:** An example of an Askaryan radio-frequency (RF) impulse [11].

## THE ASKARYAN EFFECT - OBSERVATION IN ICE AT SLAC

**Figure 11:** A second test at SLAC demonstrated the Askaryan effect in ice [7].

## TWO EXPERIMENTS: ARA AND ARIANNA

---

ARA-3

### **Proposed EVA**

ANITA 1-4

ARIANNA HRA

*South Pole:  
Amundsen-Scott Base  
Home of IceCube,  
BICEP-2, SPT*

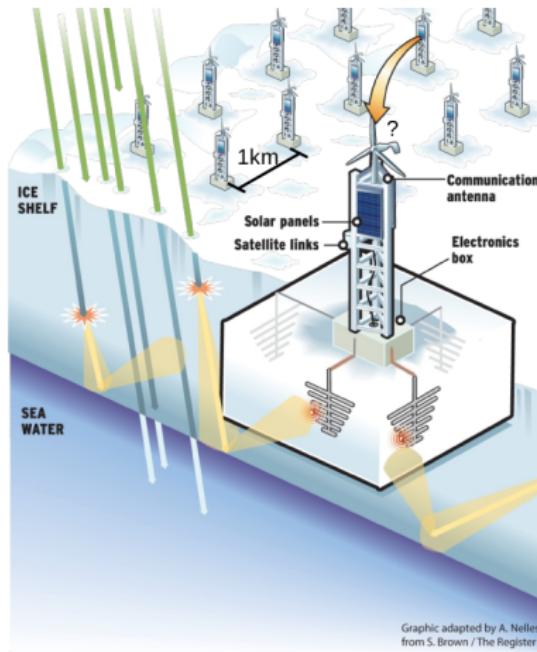

*Ross Island:  
McMurdo Station  
Williams Field Balloon  
Flight Facility*

## Antimeridian

Google Earth

# ANTARCTIC ROSS ICE SHELF ANTENNA NEUTRINO ARRAY (ARIANNA)

**Figure 12:** ARIANNA is deployed on the Ross Ice Shelf, using the ocean as a reflective surface for Askaryan RF pulses.

# ASKARYAN RADIO ARRAY (ARA)

**Figure 13:** ARA is deployed at the South Pole, taking advantage of the clearest ice on the planet.

# FROM IDEA TO ANALYSIS

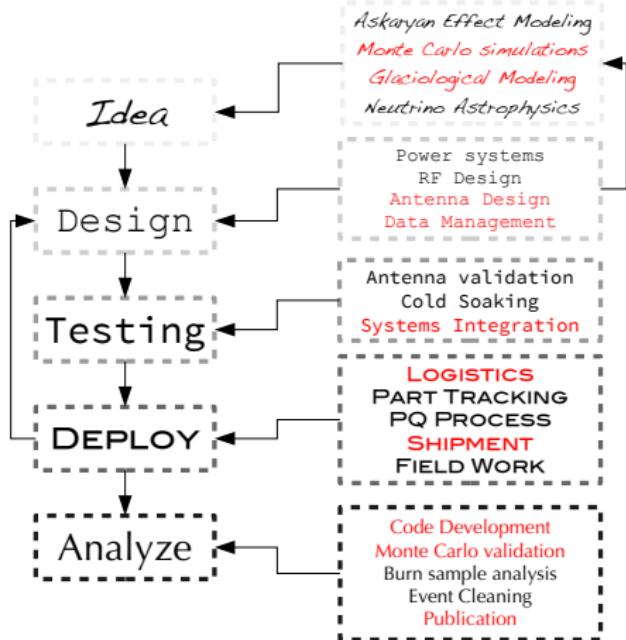

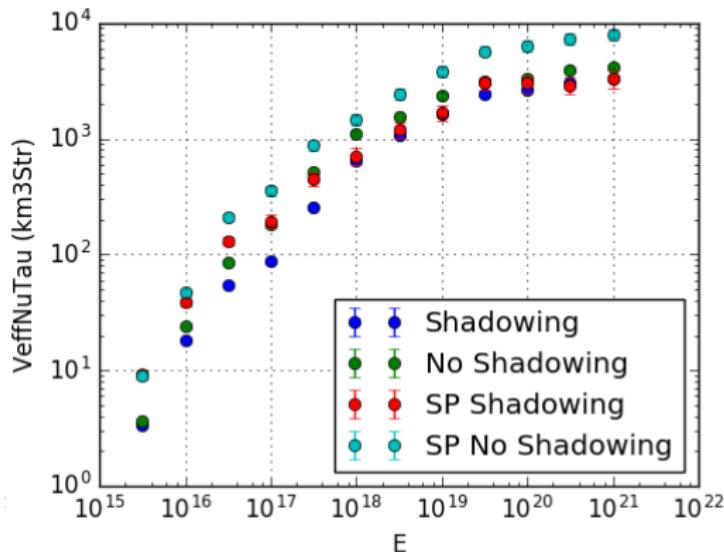

Figure 14: (Red) Contributions from undergraduates.

# MONTE-CARLO SIMULATIONS AND MACHINE-LEARNING

**Figure 15:** ARIANNA MC demonstrates the effect of Moore's Bay ice versus South Pole ice, and the *firn*. Courtesy of C. Persichilli (UC Irvine).

- Simulations produce  $V_{\text{eff}}\Omega(E)$
- Activating various effects shows relative importance
- Example: South Pole vs. Moore's Bay, *firn*

# MONTE-CARLO SIMULATIONS AND MACHINE-LEARNING

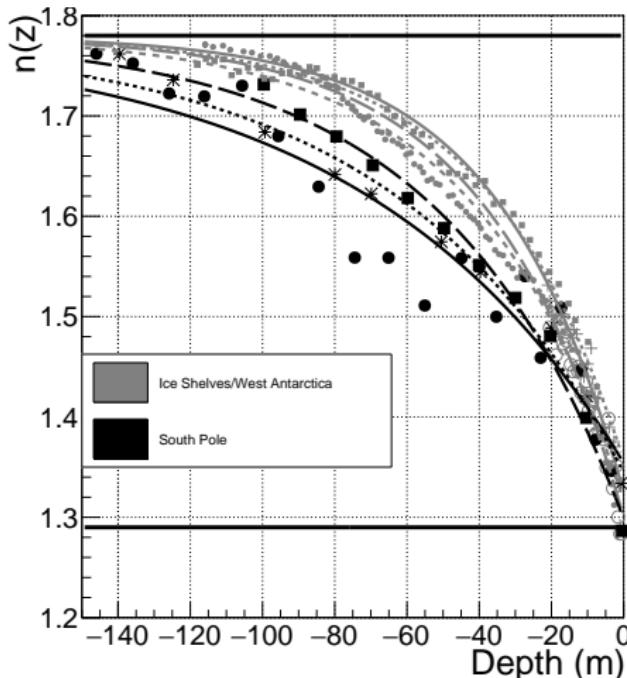

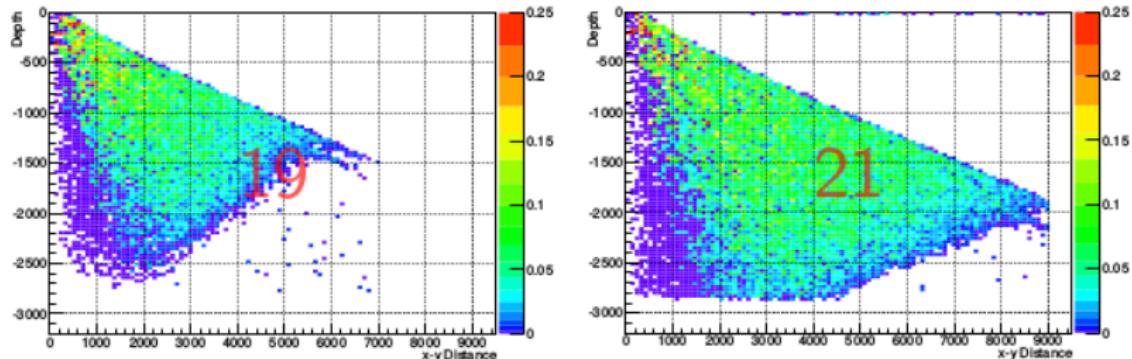

Figure 16: The index of refraction versus depth.

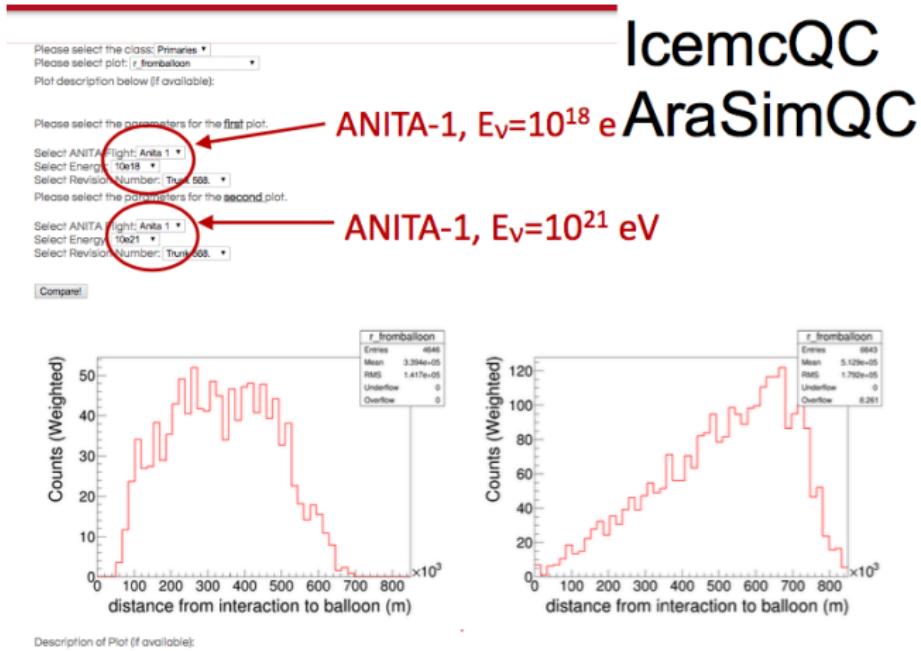

- Activating various effects shows relative importance
- The firn causes light rays to bend
- We require a solution to exist between cascade and station

# MONTE-CARLO SIMULATIONS AND MACHINE-LEARNING

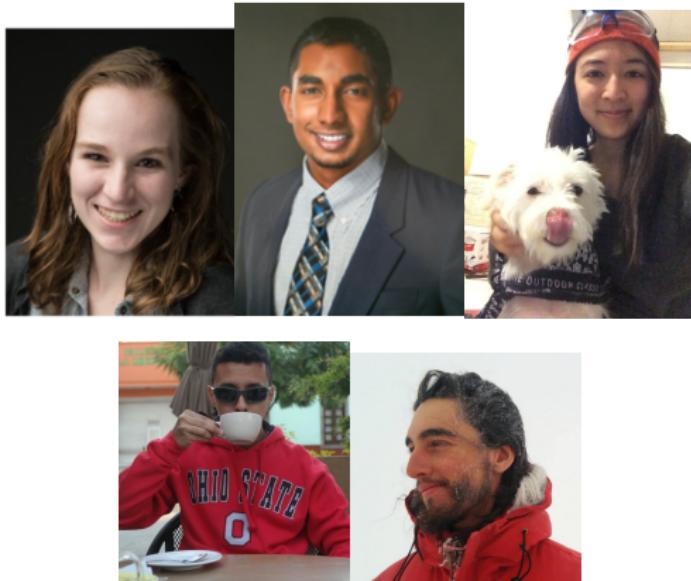

**Figure 17:** Glaciological evidence for shadowing being reviewed.  
Figure courtesy of Andrew Shultz, University of Nebraska (Physics).

# MONTE-CARLO SIMULATIONS AND MACHINE-LEARNING

**Figure 18:** Undergraduates have helped us track online the physics modifications to the simulations: AraSimQC. Pictured: UHE- $\nu$  with different energies for the same detector.

# MONTE-CARLO SIMULATIONS AND MACHINE-LEARNING

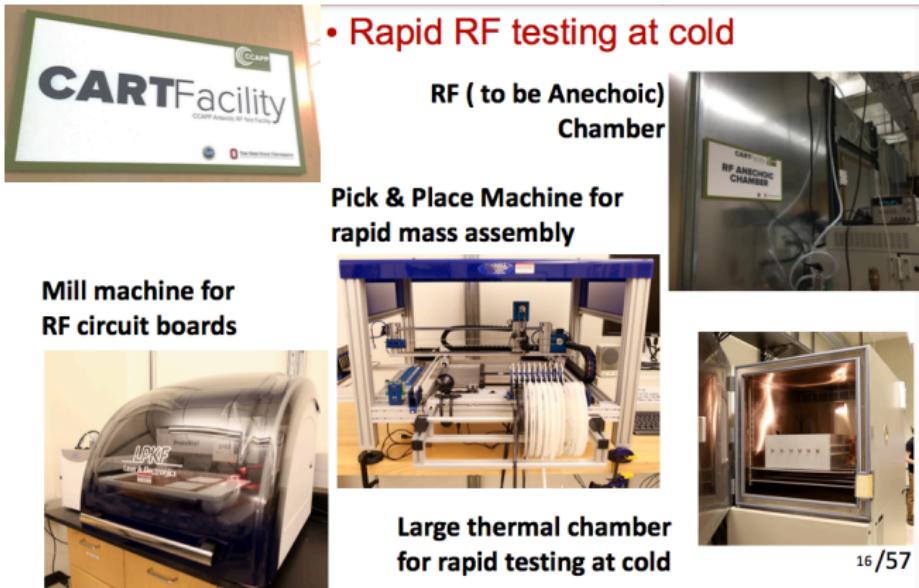

**Figure 19:** (Top row, left to right) Kaeli Hughes, Jude Rajasekara, Hannah Hasan. (Bottom row, left to right) Jorge Espinosa, Chris Persichilli.

## MONTE-CARLO SIMULATIONS AND MACHINE-LEARNING

**Figure 20:** Computing in High-Energy Physics Research (CHEAPR) 2016. Workshop devoted to exploring how machine-learning can improve our Askaryan signal recognition  
<http://ccapp.osu.edu/workshops/CHEAPR2016/workshop.html>.

**Figure 21:** Undergraduates and graduate students are responsible for ARA systems integration at Ohio State.

**Figure 27:** The ARIANNA data acquisition system triggers and digitizes simultaneously the analogue waveforms [6].

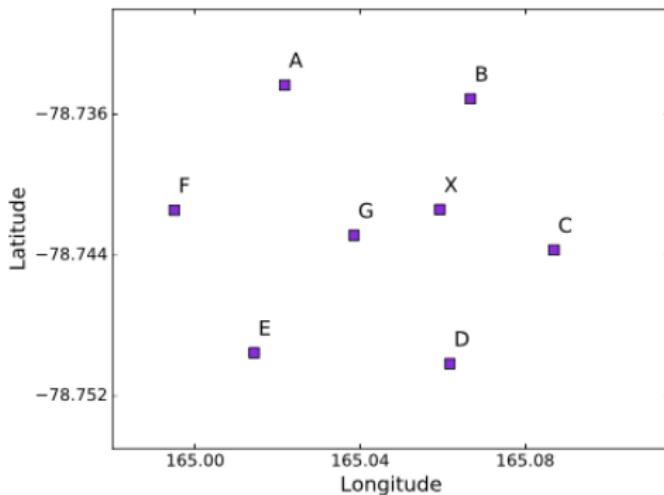

Figure 28: ARIANNA prototype: Hexagonal Radio Array (HRA) [4].

## DEPLOYMENT

---

## DEPLOYING THE HRA

**Figure 29:** (Top, left): UCI, crating. (Top, right): UCI shipping. (Bottom, left): Port Hueneme. (Bottom, right): Christchurch, New Zealand

## DEPLOYING THE HRA

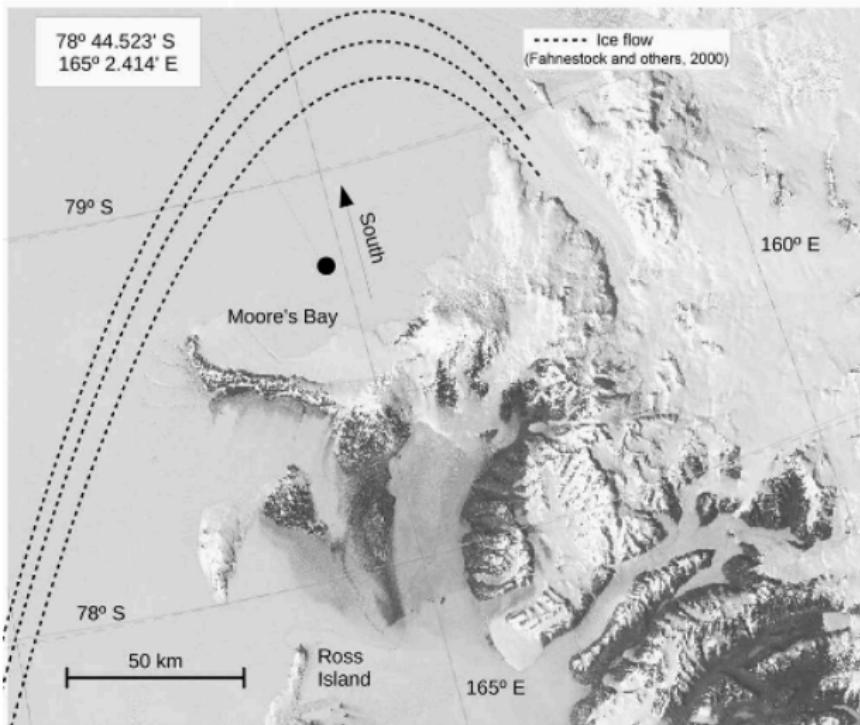

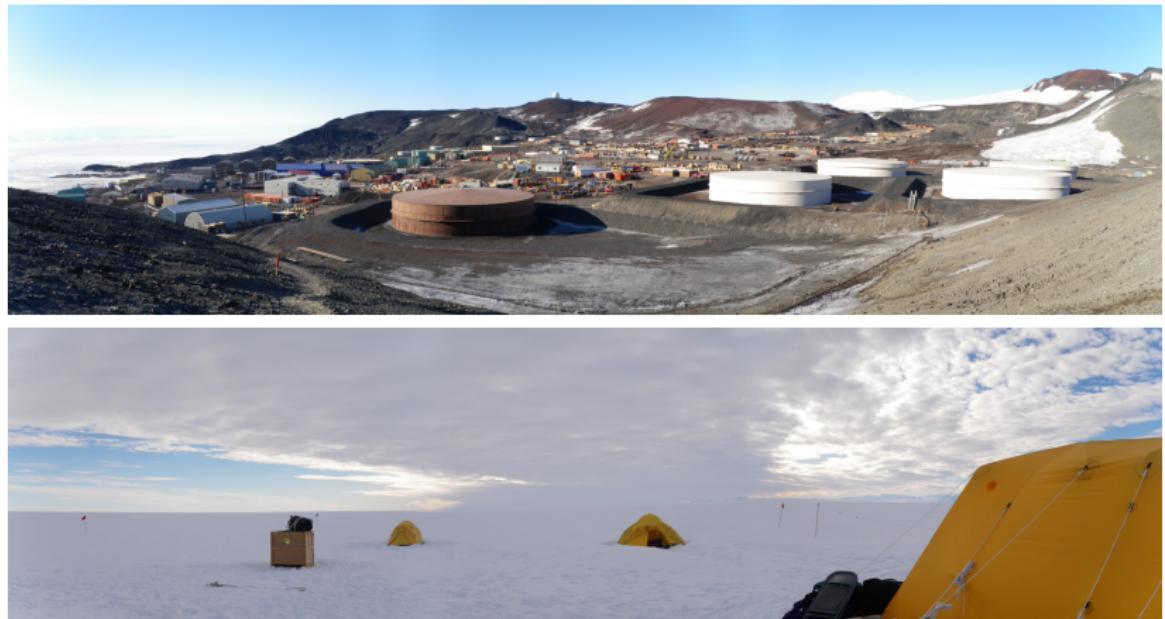

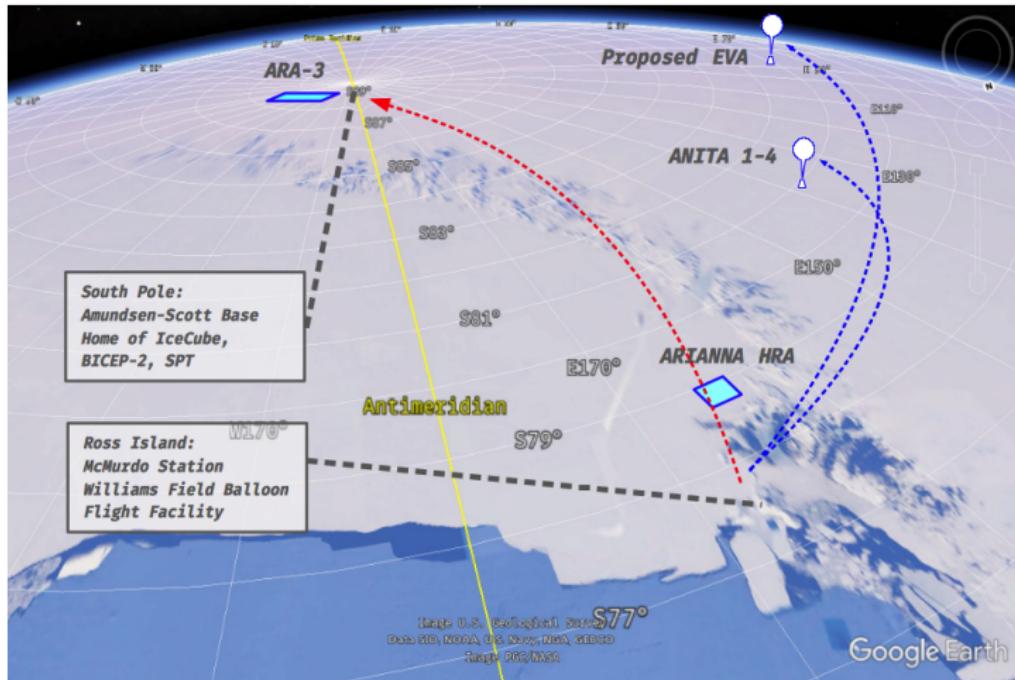

Figure 30: The HRA is located in Moore's Bay [5].

## DEPLOYING THE HRA

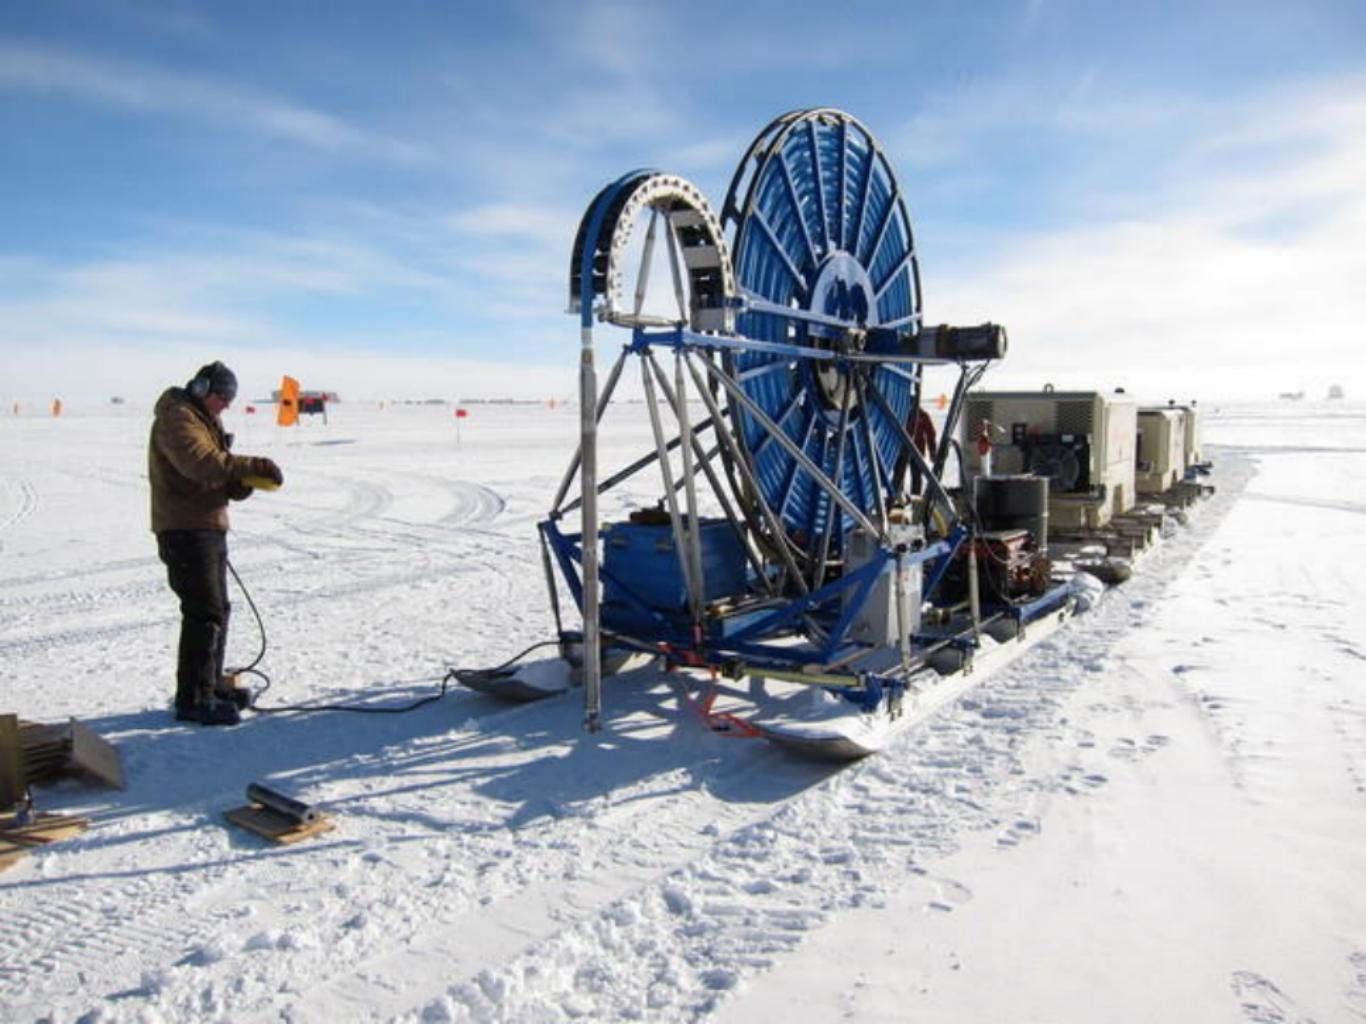

**Figure 31:** (Top): McMurdo Station, Ross Island. (Bottom): Moore's Bay, Ross Ice Shelf

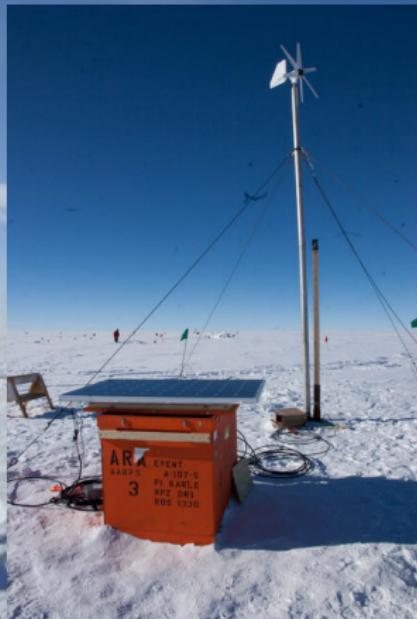

## DEPLOYING ARA2

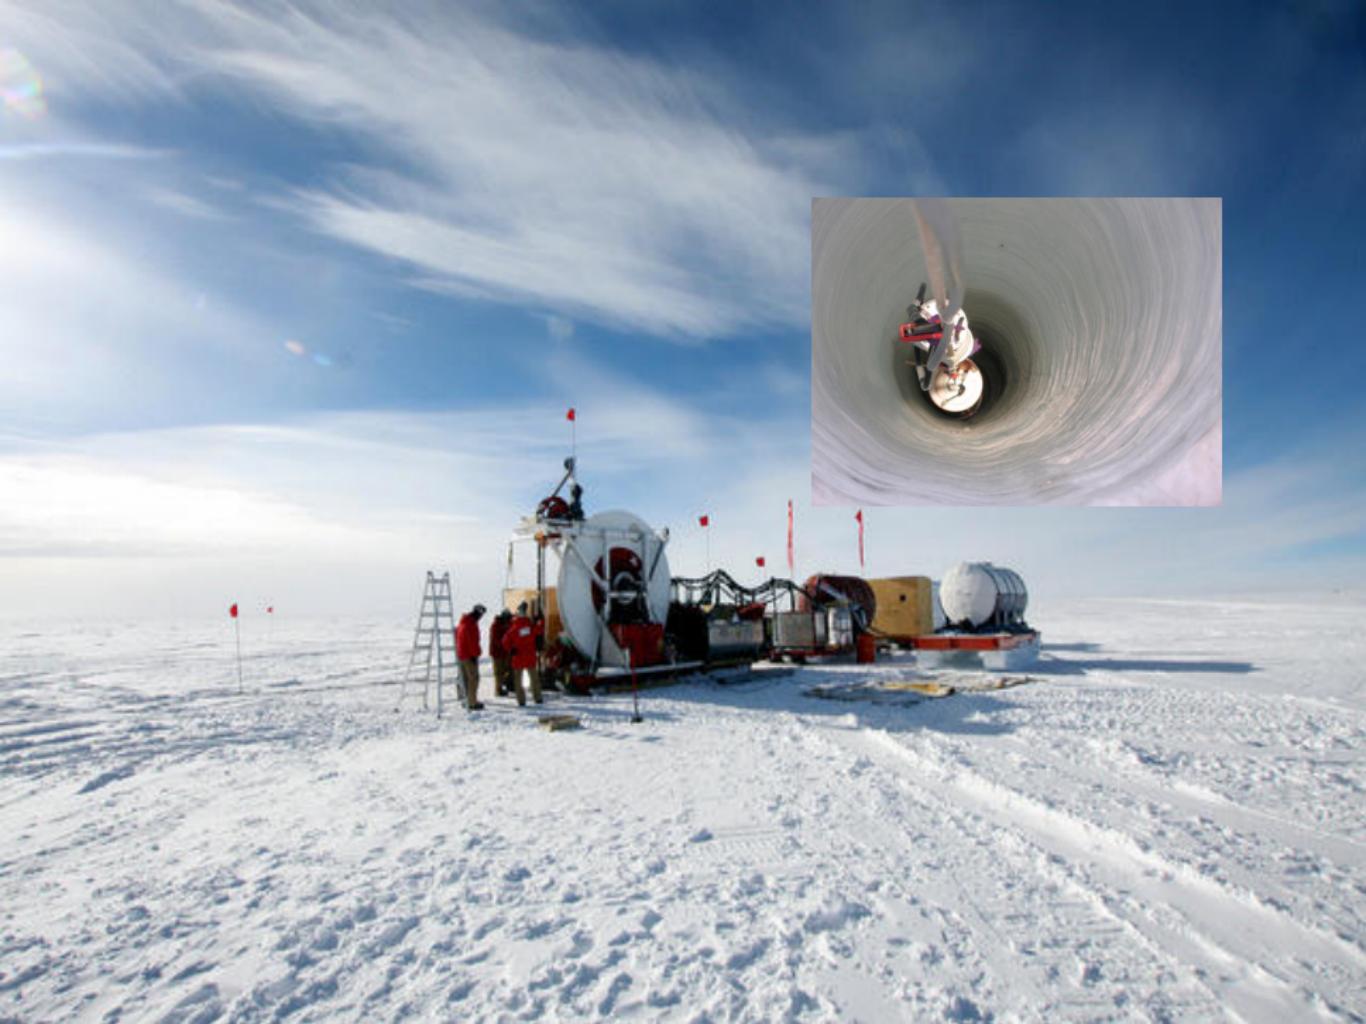

**Figure 32:** Continuing another 850 miles south to deploy ARA2.

## FILM OF ARIANNA DEPLOYMENT - YEAR 2

---

## RESULTS FROM ARA2 AND THE HRA

---

# UHE- $\nu$ RESULTS FROM THE HRA

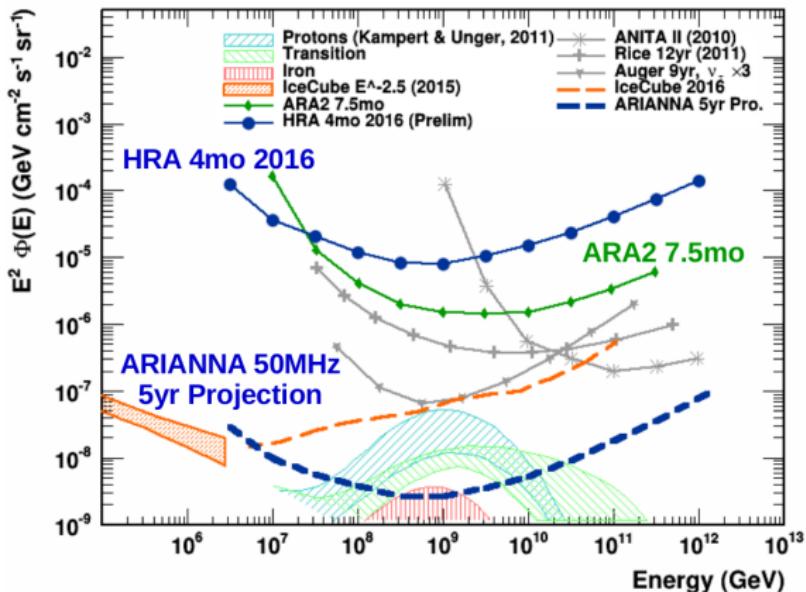

Figure 33: Latest upper-limit on the UHE- $\nu$  flux from HRA. Figure courtesy of C. Persichilli, ARA2 Result: [2].

## BONUS: HRA DETECTION OF UHECR

---

## ARIANNA HRA - DETECTION OF UHECR

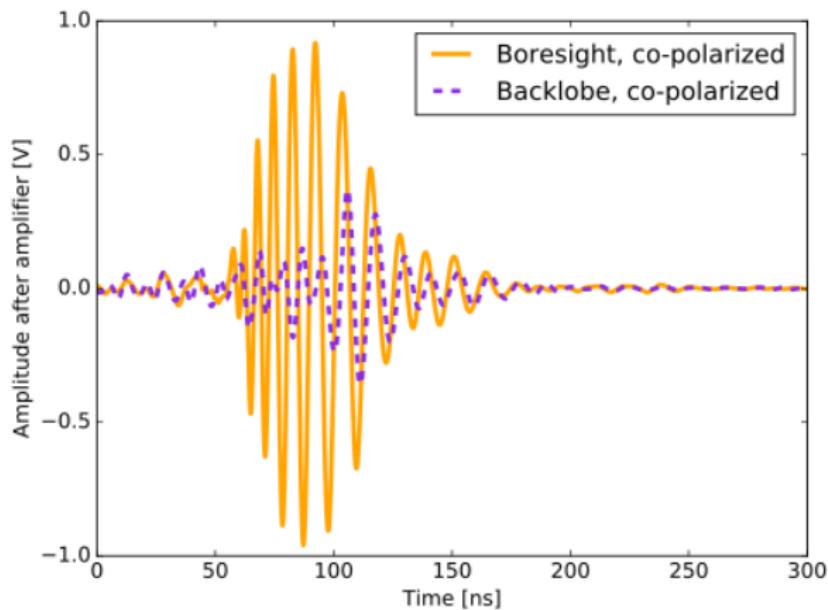

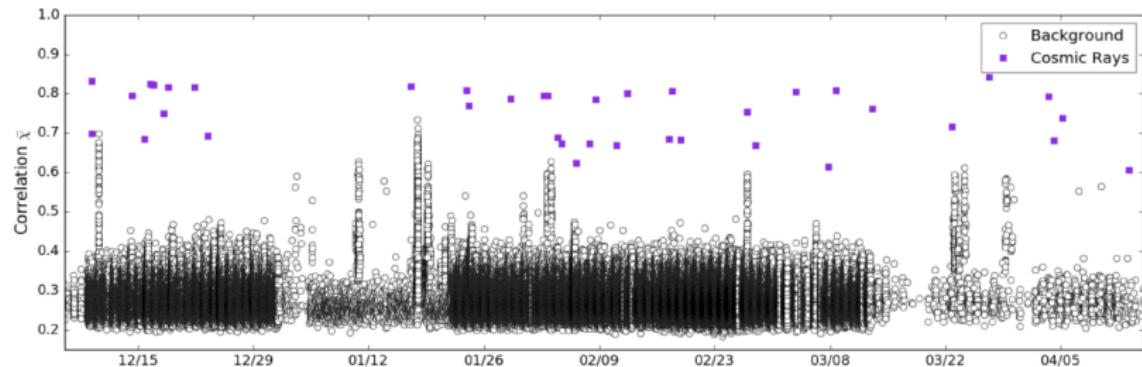

Figure 34: Building a signal template for UHECR [4].

# ARIANNA HRA - DETECTION OF UHECR (38 HITS)

**Figure 35:** Using signal templates to distinguish signal from backgrounds [4].

ARIANNA HRA - DETECTION OF UHECR

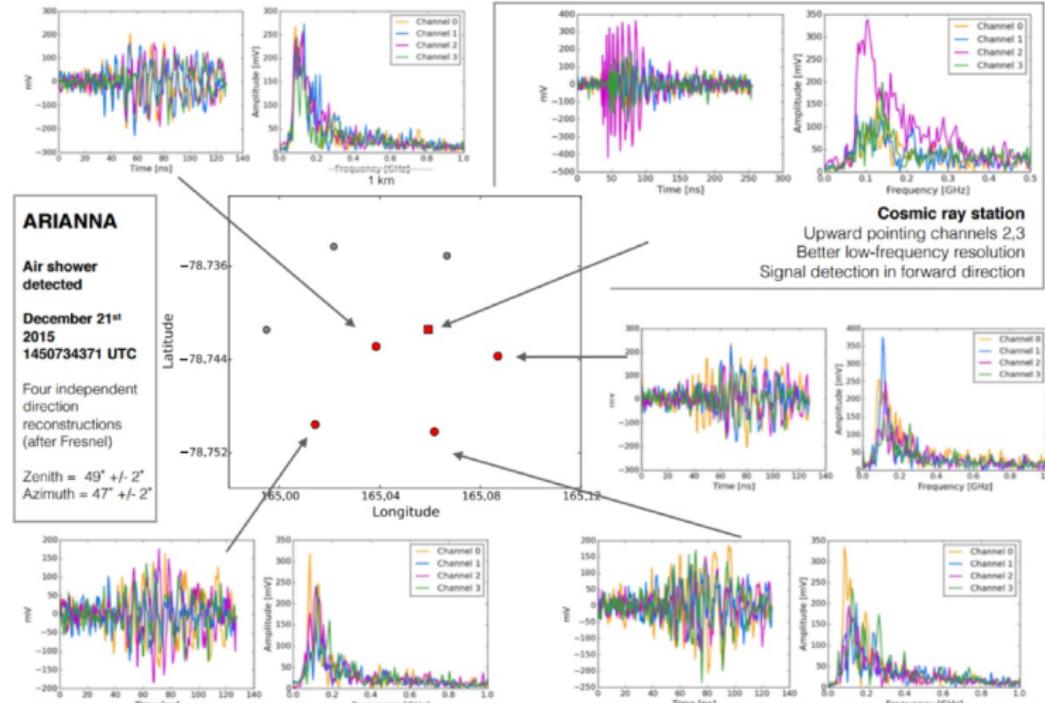

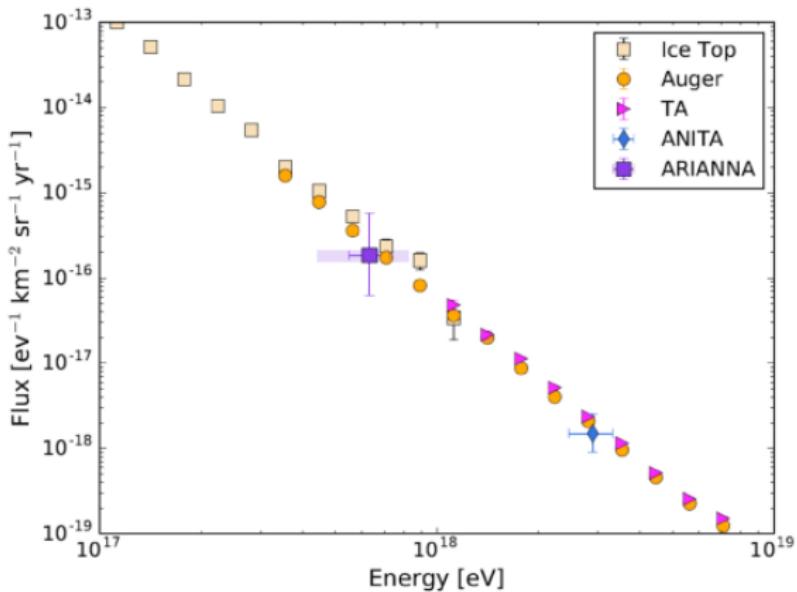

Figure 36: One event hit five stations [4]!

# ARIANNA HRA - DETECTION OF UHECR

**Figure 37:** Detection of 38 events leads to a flux measurement, with  $\langle E_p \rangle = 0.65^{+1.2}_{-1.0} \text{ EeV}$ ,  $J(E) = 1.1^{+1.0}_{-0.7} \times 10^{-16} \text{ eV}^{-1} \text{ km}^{-2} \text{ sr}^{-1}$  [4].

BONUS: ARA DETECTION OF SOLAR  
FLARES

---

# INSTITUTIONS INVOLVED IN ARA/ARIANNA

## Testbed Sees Solar Flares

- Testbed active in January 2011
- Sees two flares
  - Feb 13 2011, 17:30 UCT, M6.6<sup>1</sup>
  - Feb 15 2011, 1:50 UCT, X2.2
- Flare is identified by time coincidence of jump in trigger rates and solar position tracking

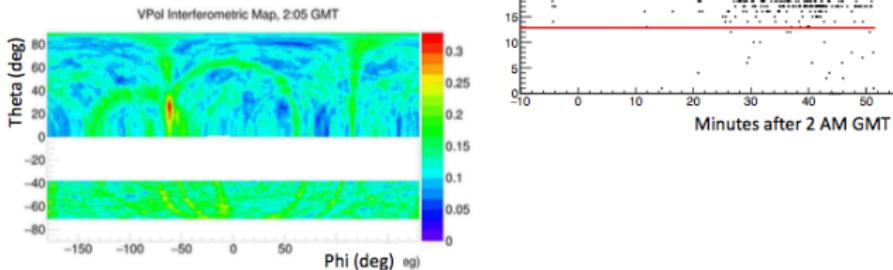

Figure 38: Courtesy of Brian Clark (OSU).

# INSTITUTIONS INVOLVED IN ARA/ARIANNA

## UHE-nu Locations (California)

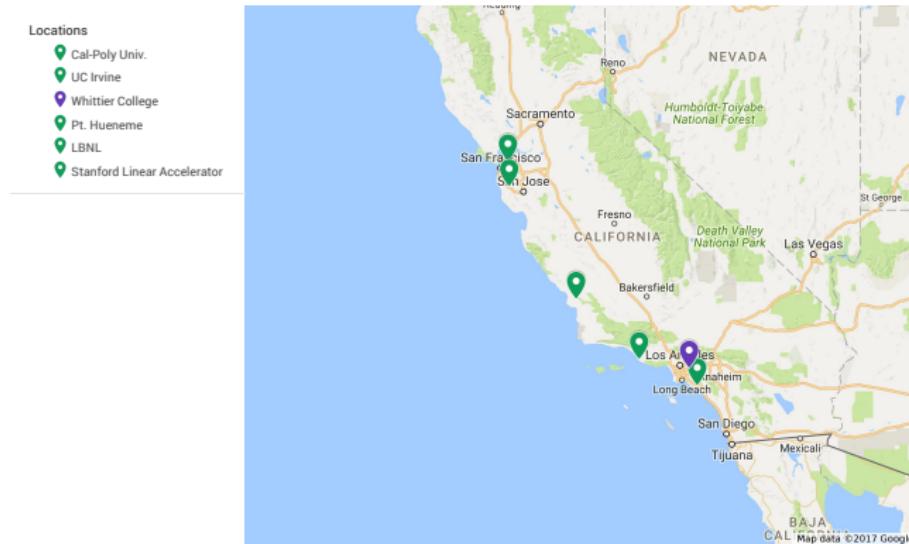

Figure 39: Participating institutions in California.

## UHECR OBSERVATION WITH HRA

---

# UHECR OBSERVATION WITH HRA

Period	Settings
December 6 <sup>th</sup> – January 4 <sup>th</sup>	Trigger 2/2 upward channels, no L1, threshold: 70 mV
January 4 <sup>th</sup> – January 22 <sup>nd</sup>	Trigger 2/2 downward channels, no L1, threshold: 70 mV
January 22 <sup>nd</sup> – February 26 <sup>th</sup>	Trigger 2/2 upward channels, L1 on, threshold: 70 mV
February 26 <sup>th</sup> – March 2 <sup>nd</sup>	Trigger 2/2 upward channels, L1 on, threshold: 72 mV
March 2 <sup>nd</sup> – March 12 <sup>th</sup>	Trigger 2/2 upward channels, L1 on, threshold: 74 mV
March 12 <sup>th</sup> – March 14 <sup>th</sup>	Trigger 2/2 upward channels, L1 on, thresholds: 82 mV
March 12 <sup>th</sup> – April 23 <sup>rd</sup>	Trigger 2/2 upward channels, L1 on, thresholds: 84 mV

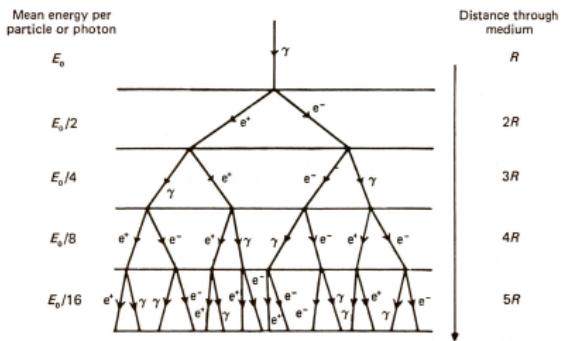

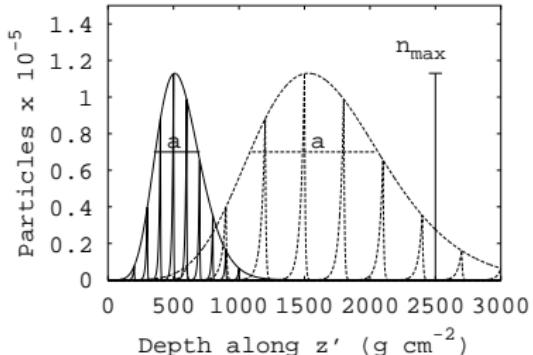

Description	Number of events	Fraction	Note
All data	653,447	100%	
After L1	578,745	88%	On station level: 75%
Option 1:			
After cluster cut	538,198	82%	Live-time loss: 6.6%
Events above 150 mV	92	0.01%	Unclear contamination with noise
Option 2:			
Cut on correlation	38	0.005%	> 98% analysis efficiency, 100% live-time

Figure 42: Tables from UHECR observation work [5].

## THE ASKARYAN EFFECT

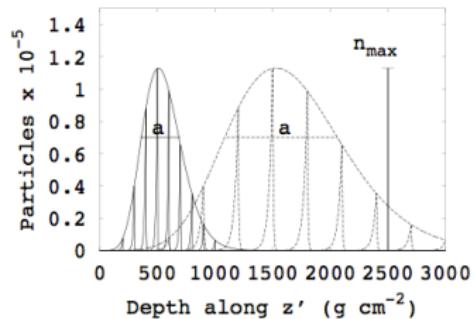

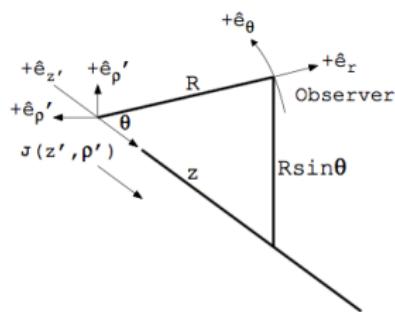

---

# THE ASKARYAN EFFECT - CONCEPTUAL UNDERSTANDING

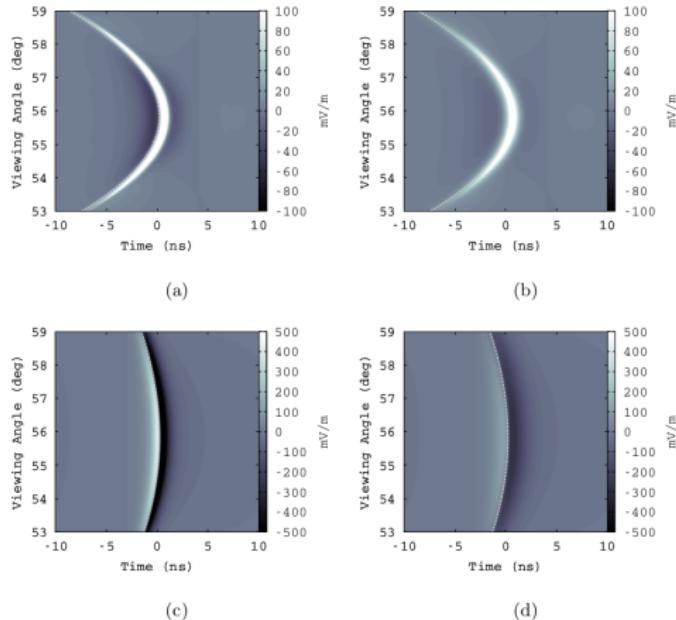

**Figure 43:** In a UHE cascade, the number of particles increases until the *critical energy* is reached ( $n_{max}$ ). Medium begins to stop particles after cascade maximum [8] [12].

# THE ASKARYAN EFFECT - CONCEPTUAL UNDERSTANDING

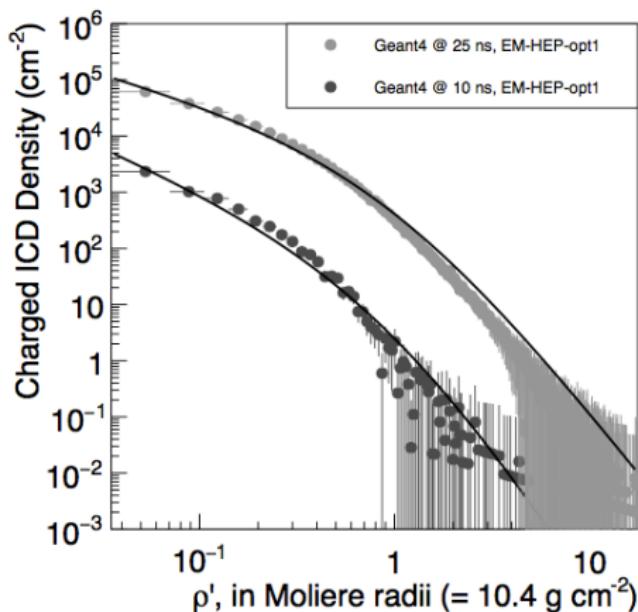

**Figure 44:** A diagram of the cascade coordinates, and observer coordinates.

# THE ASKARYAN EFFECT - CONCEPTUAL UNDERSTANDING

**Figure 45:** The Askaryan pulse at 1 EeV. (Upper left):  $R = 1000$  m, no form factor. (Upper right):  $R = 1000$ , with form factor. (Lower left):  $R = 250$  m, no form factor. (Lower right):  $R = 250$  m, with form factor.

## THE ASKARYAN EFFECT - CONCEPTUAL UNDERSTANDING

**Figure 46:** The lateral distribution of charge density for an electromagnetic cascade, at two times after the primary interaction.

## GLACIOLOGICAL PARAMETERS

---

# GLACIOLOGICAL PARAMETERS

**Table 3.** Summary of dielectric parameters. The first column is the frequency,  $\nu$ , followed by the attenuation lengths, which are uncorrected ( $\langle L_0 \rangle$ ) and corrected ( $\langle L \rangle$ ) for  $\sqrt{R} = 0.82 \pm 0.07$ . The fourth column is  $\langle L \rangle$  expressed in  $\text{dB km}^{-1}$ . The imaginary part of the dielectric constant,  $\epsilon''$ , is shown in the fifth column. The final column shows  $\nu \tan \delta$  (GHz). The typical error on the quantity  $\nu \tan \delta$  is  $0.2 \times 10^{-4}$

$\nu$ GHz	$\langle L_0 \rangle$ m	$\langle L \rangle$ m	$\langle L \rangle$ $\text{dB km}^{-1}$	$\epsilon'' \times 10^3$	$\nu \tan \delta \times 10^4$ GHz
0.100	432	449	19.3	3.8	1.2
0.175	467	487	17.8	2.0	1.1
0.250	457	476	18.2	1.4	1.1
0.325	422	438	19.8	1.2	1.2
0.400	408	423	20.5	1.0	1.3
0.475	366	378	23.0	0.95	1.4
0.550	349	360	24.1	0.86	1.5
0.625	363	375	23.2	0.72	1.4
0.700	331	341	25.5	0.71	1.6
0.775	310	319	27.2	0.69	1.7
0.850	320	329	26.4	0.61	1.6
Ave.	$380 \pm 16$	$400 \pm 18$	$22 \pm 1$	$1.3 \pm 0.3$	$1.37 \pm 0.06$

## GLACIOLOGICAL PARAMETERS
